Project ID # mat158

This presentation does not contain any proprietary, confidential, or otherwise restricted information

Overview

Timeline

- Start: August 2018
- Finish: Oct. 2020
- % complete (time): ~70%

Budget

- Total project funding
 - DOE: \$250K
 - Industrial cost share: \$250K
- Future funds anticipated: \$0

Technology Gaps/Barriers

- High cost of “primary” aluminum (Al) casting alloys
- Poor mechanical properties of “secondary” Al casting alloys
- Lack of high-strength/high-elongation casting alloys using low-cost casting processes

Partners

- Eck Industries

Relevance/Objective

- Aluminum content in light-duty vehicles
 - Current: 400 lbs. Al/vehicle; ~73% castings
 - Near future: ~500 lbs. Al/vehicle by 2025
- Challenges for greater Al usage
 - Higher cost of “primary” Al casting alloys
 - Poor mechanical properties of “secondary” Al castings
- Project scope
 - Heat-treatment techniques to lower processing cost of castings
 - Molten Al processing technique to enhance mechanical properties of “secondary” Al casting alloys
- LightMAT’s resources (at PNNL)
 - Proprietary heat-treatment techniques
 - Ultrasonic-based molten metal processing

Knuckles

Brake Calipers

Approach

Heat-treatment Development

- A206 Al alloy: 4.6% copper (Cu) – 0.35% manganese (Mn) – 0.25% magnesium (Mg) – 0.22% titanium (Ti)
- PNNL proprietary
- Goal: Shorten solution/aging

Molten Al Process Development

- A356 Al alloy: 6.5–7.5% silicon (Si), 0.25–0.45% Mg, iron (Fe)...
- 0.2% Fe (“primary alloy”)
 - 0.6% Fe (“secondary alloy”)
- Ultrasonic melt processing
- Goal: Refine the microstructure for finer intermetallics and lower dendrite arm spacing to improve ductility and more uniform properties throughout the casting

Task/Milestone Summary

Task Name/Duration	'18-Q4	'19-Q1	'19-Q2	'19-Q3	'19-Q4	'20-Q1	'20-Q2	'20-Q3	'20-Q4	'21-Q1
Task 1 Alloy Selection	■									
Task 2.1 Thermal Analysis of Selected Alloy	■	■								
Task 2.2 Design of Ultrasonic Setup		■	■	■	■	M				
Task 2.3 Solidification Under Ultrasonic Field					■	■	■	■	■	■
Task 3 Heat-treat Process Development			■	■	■	■	■	■	■	■
Task 4 Microstructural Characterization				■	■	■	■	■	■	■
Task 5 Mechanical Property Characterization									■	■

M1 (03/19): Set up an ultrasonic system for use in conjunction with molten alloys - **Achieved**

M2 (07/19): Compare hardness and microstructure of A206 following the baseline and the alternate heat-treatment performed for the same duration - **Achieved**

M3 (10/19): Compare microstructures of A356 cast with and without ultrasonic processing - **Achieved**

Accomplishments (Heat-treatment)

Baseline Property Measurement (FY2019)

Heat-Treatment Schedules and Hardness (HRB) of A206

- Maximum age-hardening after 12 hours of solutionizing
- Dissolution of Al₂Cu precipitates during solutionizing

Accomplishments (Heat-treatment)

PNNL Heat Treatment vs. Baseline

450°C Baseline as-quenched: 4 HRB
450°C PNNL as-quenched: 11 HRB

- 450°C-1 Hr. (Baseline/Conventional)
 - No solutionization (very low hardness) → Hardness does not increase after T7 treatment
- 450°C-1 Hr. (PNNL)
 - Some solutionization → Hardness increase from 11 HRB to 25 HRB after T7 treatment
 - Longer solutionization at 450°C by PNNL technique may increase T7 hardness to that achieved by solutionization at $T > 500^{\circ}\text{C}$
- 500°C (PNNL) vs. 510°C (Baseline/Conventional)
 - Similar age-hardening efficacy relative to each other, but lower efficacy than the baseline 12 hr. solutionization

Accomplishments (Heat-treatment)

Scale-up Trials

- Modified setup and conducted mock-up trials to physically accommodate full-length as-cast tension bars
- Performed trial runs to determine heating behavior of long bars vs. currently used small cylindrical samples
- Guidance for implementing the heat-treatment process to the commercial, large-sized castings

Accomplishments (Melt Processing) Setup for Ultrasonic Processing (FY2019)

• System is fully functional

Accomplishments (Melt Processing)

Process Parameters

	Ultrasonication	Ultrasonic Intensity (W/cm ²)	Duration of Treatment (s)	Total Energy Input (J)
Low Fe (0.2 wt%)	Control	0	0	0
	25% Amp – 20W	15	120	2400
	40% Amp – 50W	38		6000
High Fe (0.4 wt%)	Control	0	0	0
	25% Amp – 20W	15	120	2400
	40% Amp – 50W	38		6000

- Samples were processed at two power settings and durations
- Low-Fe: Fabricated samples for microstructural characterizations
- High-Fe: Fabricated samples for microstructural and tensile testing

Accomplishments (Melt Processing)

Low-Fe A356 – Microstructures

- Performed SEM imaging of low-Fe samples and image analysis to quantify dendrite size and intermetallic circularity
- Suppression of needle-like detrimental β -AlFeSi phase
- Intermetallics with Chinese script morphologies are observed, which are beneficial for ductility [Tash et al., MSEA, 2007]

Accomplishments (Melt Processing)

Low-Fe A356 – Dendrite and Intermetallic Refinement

- Slight refinement of Al dendrites after high-power u/sonication
- Slight coarsening in intermetallic sizes
- Greater uniformity (smaller scatter bar) after high-power u/sonication

$$\text{Circularity} = \frac{4\pi (\text{area})}{\text{perimeter}^2}$$

Circularity = 1 (circle)

Circularity = 0 (perfect oblate)

- Significantly blunt (i.e., high radius of curvature) intermetallic particles after high-power ultrasonication

Responses to Previous Year's Reviewers' Comments

- No reviewer comments

Collaboration and Coordination

Eck Industries

- Supplier to automotive OEMs and Tier-1
- CRADA between PNNL and Eck
- Al alloys supplied by Eck
 - A206 as-cast tensile samples for heat treatment
 - Primary A356 ingot with “low” Fe% and A356 with “high” Fe% to mimic secondary alloy
- Baseline heat treatments
- Tensile testing of ultrasonicated samples and heat-treated bars

Remaining Challenges and Barriers

- Optimize heat-treatment parameters for A206 Al to increase its T7 hardness from current levels
- *Stretch goal: Demonstrate tensile property improvements in heat-treated tensile bars*
 - Potential equipment limitation for heating long-bar geometry samples*
- Demonstrate intermetallic size refinement and associated improvement in tensile strength and ductility in ultrasonicated high-Fe A356
- Techno-economic feasibility of these techniques, though outside the scope of this work, needs to be addressed, such as:
 - Throughput (e.g., number of parts per run; lbs. molten metal per run)
 - Investment in new equipment vs. existing equipment

Proposed Future Work

- A206: Complete heat-treatment runs with optimized process parameters
 - Measure hardness and tensile stress–strain curve (ductility)
- A356: Complete melt processing of low- and high-Fe samples
 - Measure tensile stress–strain curves (ductility)
 - Ultrasonic processing in semi-solid state and/or at higher ultrasonic power
- Microstructural characterization
 - A206: Dissolution of Cu-containing phases during solutionization
 - A356: Morphology and size/size distribution of Fe-containing brittle intermetallic phases in high-Fe samples

Any proposed future work is subject to change based on funding levels

Summary

- Although opportunities exist to enable greater use of Al castings for automotive lightweighting, greater cost of primary alloy and poor properties of secondary alloys are a hindrance
- PNNL heat-treatment process (for A206 Al) shows the potential of being an energy-efficient alternative to the conventional heat treatment
- Ultrasonic melt-treatment processing of A356 Al shows slight refinement of dendrite size and blunting of intermetallics without any significant size change → Potential to improve ductility of secondary 356 Al
